

Oil-Based Inhibition at a Fraction of the Cost

Description

Designed utilizing high ratio potassium silicate, this is the most inhibitive water-based solution available. Even more, it is one of the most environmentally friendly available drilling fluids. Perfect for gumbo, reactive shales, or weakly cemented formations. Beyond offer the ability to run silicate as a flocculated system to build fracture gradient and reduce the risk of disposal.

Benefits

- Low-cost drilling fluid with oil-based like inhibition
- Effective in halting the hydration of clays as well as improving wellbore stability
- Low pump pressures and ECD's with SiliFloc

Product

Usage

Benefit

High Ratio Potassium Silicate

Formation dependant, recommend usage between 5 - 15 %v/v

Highly inhibitive and builds fracture gradient

Flocculant Polymers

Aid in the removal in solids

Remove the risk of drilled solids build up
